

## Sterling Highway Milepost 45-60 Project

ADOT&PF Project Number STP-F-021-2(15)/53014  
Memo to File

Date: February 8, 2008  
From: Miriam McCulloch, Ron Martindale, ADOT&PF  
CC: Mark Dalton, John Wolfe, Anna Kohl, HDR Alaska, Inc.

**Subject:** Severity of Accidents on the Existing Sterling Highway in the Project Area

**Introduction:** SAFETEA-LU specifies consideration of accident severity in its description of the Highway Safety Improvement Program (HSIP) under Section 148 of Title 23. SAFETEA-LU states that, for states to be eligible for receipt of federal highway funds, states must identify and analyze highway safety problems, using criteria that establishes relative severity of accident locations [USC 23 § (c)(2)(B) and (D)]. This memorandum completes such an analysis of highway safety problems, specifically looking at 7 fatal accidents and 19 “severe injury” accidents recorded in the project area in the 10-year period 1997-2006. Please see attached spreadsheet with accident detail. This memo is meant to supplement the accident *rate* data found in the *Sterling Highway MP 45-60 Accident Analysis* published March 2006. This analysis is more subjective and cannot be reduced to a simple number like an accident rate that can be compared to other highways but is useful for examining the specifics of the MP 45-60 area.

**Interpretation of relative severity of accident data in the project corridor:** An analysis of the 7 fatal and 19 severe injury crashes on this portion of the Sterling Highway from 1997-2006 reveals that:

- Head on crashes account for over 46% of fatal and major injury crashes on this segment.
- Head on crashes account for 5 of the 7 fatalities.
- 5 of the 7 fatal crashes involved vehicles out of control or changing lanes.
- Unsafe speed was a factor in 9 of the 26 fatal and major injury crashes and 4 of the 7 fatalities.
- Run of the road crashes (Culvert, ditch, embankment, overturn) account for 42% of the fatal and major injury crashes and 2 of the fatal crashes.
- 5 of the 26 fatal and major injury crashes involved drivers falling asleep.
- 54% of the fatal and major injury crashes occurred in a curved section of highway.
- 4 of the 7 fatal and 11 of the 19 major injury crashes occurred on dry pavement.
- 3 of the 7 fatal and 5 of the 19 major injury crashes occurred on snow/ice covered pavement.
- 5 of the 7 fatal crashes occurred during daylight hours. The other 2 fatal crashes occurred during twilight lighting conditions.

- 5 of the 7 fatal crashes were two vehicle collisions. The other two were single vehicle collisions.
- 5 of the 7 fatal crashes and 12 of the 19 major injury crashes involved the “at fault” vehicle traveling in the eastbound or northbound (towards Anchorage) direction.

**Accident clusters:** The statistics indicate there are two clusters of fatal and major injury accidents in the project area:

- (1) Bean Creek/Snug Harbor, and
- (2) “Gwin’s” curve at Gwin’s Lodge.

The Project addresses these accident clusters by providing alternatives (the three build alternatives) that divert traffic from the existing highway. The No Build Alternative will not reduce accidents at these locations, since traffic volumes will not be diverted.

**Potential mitigation to improve safety:** Based on the accident statistics and patterns noted above, it is possible to suggest measures that could help to reduce fatal and major injury accidents. Note that some of these mitigation measures may be addressed by the alignment alternatives proposed for the Sterling Highway MP 45-60 Project, and some could be considered as separate measures unrelated to the MP 45-60 Project.

Potential Mitigation	Fatal & Severe Crashes Addressed
Realignment (straightening)	Head-on and run off the road on curves
Widened shoulders	Run off the road crashes
Centerline rumble strips	Head on crashes; “fell asleep” crashes
Shoulder rumble strips	Run off the road and “fell asleep” crashes

**Conclusion:** The issue of safety, as illustrated through the severity of accidents in the project corridor, appears to support the project’s need, although safety alone does not constitute an individual aspect of this project’s Purpose and Need. This analysis indicates that safety improvement could help to reduce major accidents in the Sterling Highway MP 45-60 area. The MP 45-60 project would principally address these problems by bringing the entire segment of highway to current Rural Principal Arterial geometric standards. This would include wider lanes and shoulders, broader curves, better sight distances, better clear zones, passing and climbing lanes, turn pockets, and access control, most of which do not meet current standards on the existing highway. Under the alternatives, varying lengths of the existing highway would be replaced with new highway on a new alignment. In those locations, the existing highway would remain physically unchanged but would see reduced traffic volumes. It may be necessary to further examine local mitigation measures for specific curves or intersections on any portion of existing highway that is not realigned as part of the project. Any such effort would likely be separate from the MP 45-60 Project.
